

	Name	Modified	Type
	Send Monthly Rental Report Request	2 d ago	Scheduled
	Send Weekly Rental Report Request	3 mo ago	Scheduled

I managed the end-to-end ETL (Extract, Transform, Load) process for weekly vendor updates, centralizing fragmented data into a structured format. This critical phase involved extensive data cleansing and auditing to address anomalies, ensuring that only verified, high-quality data was promoted to the production environment.

Following data validation, I engineered a C# integration script within MS Visual Studio to automate the ingestion of weekly raw data into MS SQL Server. I architected the underlying database schema, defining optimal data types to ensure high performance and scalability. This end-to-end pipeline prioritized data integrity, utilizing advanced DML and DDL SQL statements (SELECT, INSERT, UPDATE, DELETE) to maintain a secure and normalized single

source of truth' for the organization.

Following the successful migration of data to the SQL Server, I leveraged Power BI to architect dynamic dashboards that empowered Senior Plant Management with advanced data visualizations. These tools facilitated the monitoring of key KPIs and the identification of critical cost-saving trends. A key outcome of this analysis was the discovery of pickup truck overutilization; by addressing this inefficiency, we successfully mitigated unnecessary rental expenditures and established a system of accountability for departmental usage.

Burns Harbor Weekly Rental Report

Summary: By bridging the gap between front-line operations and technical execution, I partnered with the Plant Rental Coordinator to transform a manual, fragmented process into a high-impact digital solution. This collaboration was deeply rewarding, as it allowed us to leverage collective expertise to design a system that not only automated administrative burdens but also fostered a new culture of transparency across the organization.

The resulting visibility provided by my Power BI dashboards empowered leadership to identify significant fleet overutilization, directly mitigating unnecessary rental expenditures and driving long-term fiscal responsibility. Successfully delivering a "single source of truth" that provides measurable cost savings and departmental accountability has been a standout achievement in my professional development.

Going Forward:

- Demand Forecasting & Inventory Optimization: By applying statistical modeling to historical rental cycles, the system can predict future equipment needs. This allows the plant to proactively adjust fleet levels, preventing "panic rentals" during peak seasons and reducing the cost of maintaining idle equipment.
- Predictive Maintenance & Cost Projection: Utilizing usage data (such as engine hours) allows for predicting equipment failure before it occurs, significantly reducing unplanned downtime and maintenance costs. Furthermore, advanced DAX forecasting in Power BI can project year-end expenditures, informing strategic "rent vs. buy" decisions for high-utilization assets like pickup trucks.
